

COLLECTIVE INTELLIGENCE TOOLKIT

We harness collective intelligence to build or rebuild organizations, networks and communities around what is alive in the ecosystem. This means, focusing on what works well, rather than trying to fix what doesn't.

This toolkit is based on Appreciative Inquiry, Human Centered Design, Agile, Art of Hosting and many other approaches which host well designed and meaningful conversations aimed at solution design rather than overused problem solving.

Our model utilizes and illuminates a flow of three steps:

Appreciation: Identify and Validate

We look for what is already alive in the ecosystem, so we focus on what is working well, being aware of needs and ambitions, validating them with the people involved.

Ambition: Design and Plan

We ground the envisioned story of what would work well in the future, then with you we co-design scenarios and prioritize actions in order to plan the best roadmap.

Activation: Act and Measure

We focus on deployment and implementation of the proposed roadmap by developing specific actions and measure the results to inspect and adapt.
